

BEAM Pro Wall Mount Installation Guide

- Unscrew and disassemble bracket.
- Unscrew BEAM Pro mounting screws and attach first half of bracket (smaller side); ensure screws are tight.
- Trim power cable to appropriate size and install Phoenix Connector and power supply.
- Find and mark the center of the display on the wall. Find and mark the location of studs. Adjust the mount position horizontally on the wall to be centered with the display.
- At this time, retrieve proper mounting hardware for your walls. This example bracket is being mounted into drywall and wood studs placed 16" on center.
- Install first screw into stud to hold the mount on the wall. Use a level to accurately mount the bracket. Install second screw into stud, securing the bracket to the wall.
- Install third and fourth screws to finish securing the bracket to the wall.
- Place BEAM Pro on the wall bracket and insert screws at one of the three angle anchors. Use the same anchor position for both sides.
- Connect Phoenix Connector to supply power to BEAM Pro.

BEAM Pro is now powered on and should appear similar to the picture above. Look for the green LED on the front right signifying power is on.
